DNS configuration

There are two options for pointing a root domain to Netlify.

Recommended: point ANAME or ALIAS record to sharp-joliot-3c523b.netlify.app

Use a DNS provider that supports ANAME or ALIAS records, and alias kourban.com to sharp-joliot-3c523b.netlify.app.

We recommend using [NS1](#) or Netlify's built-in DNS service for this.

kourban.com ALIAS sharp-joliot-3c523b.netlify.app.

Alternative: point A record to 104.198.14.52

Create an A record for kourban.com pointing to our load balancer's IP address 104.198.14.52.

kourban.com A 104.198.14.52

⚠ Warning! With your current configuration, you won't benefit from the full advantages of a CDN if you use an A record.

We recommend setting **www.kourban.com** as your primary custom domain, or switching to a DNS provider that supports ANAME or ALIAS records.

If you've already done this, allow up to 24 hours for the changes to propagate, or check our [documentation](#) for more information.

Use Netlify DNS

Use Netlify DNS

To make sure you get the best possible performance, use Netlify's high-performance, managed DNS service. Don't worry about ALIAS or CNAME records, and easily enable branch subdomains.
